1 Executive Summary

Quality Engineering Solutions, Inc. (QES) was tasked with performing the Airport Pavement Management Program (PMP) for the Auburn Municipal Airport. The development of the plan required a site visit to assess the existing condition of the pavement sections, updates to the maintenance and rehabilitation work completed, updates to the maintenance and rehabilitation policies and unit costs, and updates to the airport network layout. The PAVER software was updated with the collected information and future conditions for three different scenarios were calculated.

Condition

The Pavement Condition Index (PCI) is calculated based on the results of a visual condition survey in which distress types, severity, and quantities are identified. The area-weighted PCI for the airfield pavements that were inspected in 2024 is 54. The PCI is calculated based on the results of a visual condition survey in which distress types, severity, and quantities are identified. A total of 31 pavement sections were inspected in 2024. Table 1 shows a consolidated version of the area-weighted PCI for the airfield pavements. Refer to Sections 4 and 5 and Appendix A for detailed information on the pavement inventory and evaluation.

Table 1. Area-Weighted PCI by Pavement Use

Use Category	Number of Sections	Total Area (SF)	% of Total Area	Weighted Average PCI
Apron	14	881,865	64%	48
Helipad	2	23,446	2%	100
Runway	3	309,108	23%	61
Taxiway	12	154,541	11%	64
All	31	1,370,960	100%	54

Maintenance and Rehabilitation (M&R) Plans

The PAVER software was utilized to generate PCIs and assess the needs for maintenance, rehabilitation, and reconstruction of the pavements at Auburn Municipal Airport. Four distinct maintenance and rehabilitation (M&R) plans were devised. While three plans were based on an unlimited budget, the fourth plan, hereafter referred to as the “Allocated Budget,” incorporated the following specific annual amounts:

- **Localized Safety (Stop Gap) and Preventive Maintenance:** \$40,000, matching the airport’s existing annual maintenance budget.

- **Global Preservation:** \$72,000, determined based on the findings from the unlimited budget analysis.
- **Major Rehabilitation:** \$1.22 million, also derived from the unlimited budget scenario.

Under the unlimited budget scenario, two comprehensive 5-year M&R plans were formulated, along with an additional 1-year plan specifically aimed at addressing immediate localized distresses. In contrast, for the Allocated Budget scenario, a single 5-year plan was established. Table 2 details the annual costs and PCI changes for all four M&R programs evaluated. For an in-depth discussion on the development and outcomes of these M&R plans, refer to Section 6 and Appendices E and F.

Table 2. Summary Annual Estimated Costs and PCI Change for the M&R Plans

Year	Unlimited Budget			Allocated Budget
	5-Year Plan Critical PCI 40	5-Year Plan Critical PCI 55	1-Year Localized Preventive	5-Year Plan Critical PCI 55
2024	\$2,999,853	\$6,554,015	\$871,687	\$1,721,731
2025	\$3,445,381	\$39,467	\$ -	\$1,326,757
2026	\$898,590	\$50,231	\$ -	\$1,234,797
2027	\$88,836	\$62,555	\$ -	\$1,167,653
2028	\$1,146,035	\$76,236	\$ -	\$934,779
Total	\$8,578,694	\$6,782,504	\$871,687	\$6,385,717
2024 PCI	54	54	54	54
2028 PCI	74	78	55	83

2 Introduction

Quality Engineering Solutions, Inc. (QES) was tasked with updating the Airport Pavement Management Program (PMP) for the Auburn Municipal Airport in Auburn, California. This update to the PMP, conducted following FAA Advisory Circular AC No: 150/5380-7B, aims to assist the airport in finding optimum strategies for maintaining pavements in a safe serviceable condition over a specific period for the minimum cost. The tasks included in the PMP update include the following:

- Complete airside pavement distress condition survey following the procedures in ASTM D5340, Standard Test Method for Airport Pavement Condition Index Surveys.
- Updates to the PAVER pavement management software from the 2011 evaluation, including updating any maintenance and rehabilitation (M&R) projects completed since 2011, updating the recommended treatments in the decision tree, updating costs for such treatments, and reviewing the deterioration curves.
- Developing current PCI reports.

- Developing 5-year project plans.
- Submitting a PMP report.

This report documents the findings of a PMP conducted at Auburn Municipal Airport, managed by the City of Auburn. The PMP assesses the current state of the pavement, noting any visible distress, and catalogs historical M&R efforts across the airfield. QES conducted a comprehensive pavement investigation and proposed three M&R strategies for the airport.

The primary goal of the PMP is to outline a prioritized agenda for pavement rehabilitation and reconstruction projects. It also aims to delineate scheduled maintenance activities, ensuring that the pavement network remains serviceable and cost-effective. Additionally, the PMP functions as a guide for scheduling preventive maintenance, which is crucial for prolonging pavement lifespan.

Utilizing the PAVER software, developed by the U.S. Army Corps of Engineers, the analysis incorporated data from recent field investigations to suggest a prioritized and strategic list of projects. This software also aids in predicting future pavement conditions by applying an estimated deterioration rate.

3 Site Information

The Auburn Municipal Airport is a general aviation facility located three miles north of Auburn in Placer County, California. Positioned at an elevation of 1,536 feet with coordinates of 38°57'17"N 121°04'54"W, the facility is managed by the City of Auburn and spans approximately 285 acres. It features one runway, Runway 7/25, which is 3,700 feet long and 75 feet wide, with 240-foot overruns at each end. An aerial view from Google Earth, dated May 17, 2023, is depicted in Figure 1.

Figure 1. Aerial View of Auburn Municipal Airport

The airport provides various services, including air ambulance, aviation fuel supply, flight instruction, private charters, and rentals, alongside aircraft repair and maintenance. It supports essential operations for the Placer County Sheriff's Office and the California Highway Patrol's Valley Division Air Operations.

The weather conditions for Auburn airport typically feature warm, dry summers and cool, wet winters. Figure 2 shows the average monthly temperature variations at the airport location.

Figure 2. Monthly Minimum, Average, and Maximum Temperatures for Auburn Airport

4 Pavement Inventory

Based on the contents of the pavement inventory, including the pavement use, surface type, and structural composition, the network of airside pavements was divided into smaller, more manageable components for inspection and maintenance management purposes. A description of the three network components is provided below.

- **Branches** - defined as any identifiable part of the pavement network which is a single entity that serves a distinct function within the network, such as runways, which facilitate aircraft takeoffs and landings. Taxiways, aprons, T-Hangers, and Helipads are also categorized as individual branches. This structure allows for targeted maintenance strategies and a clear understanding of the airport's pavement infrastructure needs.
- **Sections** - defined as parts of the branch that share common attributes, such as date of last construction, performance, pavement structure, and/or traffic.
- **Sample Units** - defined as a convenient area of a pavement section which is designated only for the purpose of pavement inspection. For bituminous concrete airfield pavements, ASTM D5340-12 recommends that sample unit areas should measure 5,000 sq. ft. with a tolerance of +/- 2,000 sq. ft. For PCC pavements, sample units are defined by slabs rather than by area. Each sample should have between 12 and 28 slabs, with a target number of 20 slabs.

The existing PMP naming convention was not changed for the Auburn airport for the 2024 update. The PMP nomenclature uses the following conventions:

- **Network ID:** Corresponds to the FAA three letter designation (e.g., AUN)
- **Network Name:** Auburn Municipal Airport
- **Branch ID:** A branch is given an alphanumeric designation, with the first letter being R, T, A, or H for Runway, Taxiway, Apron, or Helipad. Runways, Taxiways, and Aprons were identified sequentially. For instance, R1, T1, T2, T3, A1, A2, A3, etc.
- **Branch Name:** Is the actual facility name. For example, R1 is Runway 7/25, T1 is Taxiway 1, A1 is Apron 1, etc.
- **Section:** A branch is broken into sections of consistent age and cross-section, and then named sequentially with alphabetic letters, starting with A. For example, Apron 1 (A1) consists of two sections A, B, and C.

4.1 Inventory Updates

The following updates to the airport inventory were identified from information provided by the airport and the 2024 field inspection conducted by QES:

Table 3. Summary of PMP Updates

Branch Name	Update	Year
Helipad 1	Removed	2023
Helipad 2	Removed	2023
Helipad 3	Built	2023
Tie-Down Apron 1	Slurry Sealed	2017
Tie-Down Apron 2	Slurry Sealed	2019
Tie-Down Apron 4	Slurry Sealed	2019

4.2 Inventory Results

AUN consists of a single runway with a parallel taxiway, connector taxiways, and apron and helipad areas. The airside consists of Asphalt Concrete (AC) pavements, Asphalt Overlays on AC (AAC) pavements, and Portland Cement Concrete (PCC) slabs in the Helipad 3 area. The runway dimensions at AUN are as follows:

- Runway 07-25: 3,700 ft x 75 feet wide, with 240-foot overruns at each end.

There are 23 branches (facilities) at AUN that include 31 pavement sections and a total area of approximately 2,090,500 square feet. Table 4 lists the pavement branches for AUN.

Table 4. Airport Branches Number of Sections and Area

Branch ID	Branch Name	Number of Sections	Area (SF)
A1	APRON 1	2	78,140
A2	APRON 2	1	77,800
A3	APRON 3	1	8,800
A5	APRON 5	1	8,960
A6	APRON 6	1	4,000
A7	APRON 7	1	18,300

TD5	APRON	1	45,484

Figure 3 presents the distribution of airfield pavement by surface types (area in square feet and area %) along with the distribution of pavement area by usage.

Figure 3. Pavement Area (SF) by Surface Type and Branch Use

An updated Network Definition Plan showing the Branches, Sections, and Sample Units is presented in Appendix A.

5 Pavement Evaluation

5.1 Pavement Evaluation Methodology

A field Pavement Condition Index (PCI) inspection was conducted by QES on February 16, 2024 in accordance with the guidelines and procedures described in the following documents:

- ASTM D5340-20, Standard Test Method for Airport Pavement Condition Index Survey.
- FAA Advisory Circular 150/5380-7B, Airport Pavement Management Program (PMP) (https://www.faa.gov/documentLibrary/media/Advisory_Circular/150-5380-7B.pdf).
- FAA Advisory Circular 150/5380-6C, Guidelines and Procedures for Maintenance of Airport Pavements (https://www.faa.gov/documentLibrary/media/Advisory_Circular/150-5380-6C.pdf)

During a PCI inspection, inspectors walk over the surface of the pavement and identify visible signs of distress within a sample unit. The map used during the inspection to locate the inspected sample units is presented in Appendix A. Each distress type is identified, then classified as low, medium, or high severity, and recorded in our proprietary tablet-based rating software.

The PCI offers a numerical measure of the overall condition of pavement, utilizing the extent and types of deterioration to compute the PCI for each section. Values range from 0, indicative of failed pavement, to 100, denoting pavement in excellent condition. Figure 4 presents an example of different pavement conditions and their corresponding PCI values for three sections of Auburn Airport.

Figure 4. Example of PCI versus Pavement Condition

The PCI serves as a guide to the necessary level of rehabilitation for a specific pavement segment. Typically, when the PCI exceeds 60, maintenance efforts like crack sealing, joint sealing, slurry seals, and patching are effective. However, as the PCI decreases, more substantial rehabilitation measures, including overlays, become necessary. In cases where the PCI is significantly low,

indicating severe damage, reconstruction may be the only feasible option to restore the pavement's structural integrity and functionality. Figure 5 presents the relationship between the PCI of a pavement section and the corresponding repair types required along with a typical pavement performance curve. It also includes the color codes used in the report's maps and charts for each PCI range, enabling an understanding of pavement conditions and necessary interventions.

Figure 5. PCI versus Pavement Repair Type

When determining the most suitable repair approach it is important to consider additional factors beyond the PCI score. These factors include the specific types of distress observed, their underlying causes, and the rate at which the pavement deteriorates. Moreover, because the PCI assessment does not account for the structural capacity and integrity of the pavement, incorporating analyses of these aspects is advised to enhance and verify the chosen repair strategy.

5.2 Pavement Evaluation Results

Table 5 presents a summary of the PCI field evaluation conducted for all pavement sections in 2024 at AUN. The Last Major Work date corresponds to the most recent major (e.g., AC overlay) M&R date. The computed PCI values for sections at AUN range from a low of 1 (Apron 9 Section A) to a high of 100 (Helipad 3 Sections A and B). As seen in the table, most of the pavements at AUN are in Fair and Poor condition. The 2024 area-weighted condition of AUN corresponds to 54 (Poor Condition). For the previous inspection, conducted in 2012, the area-weighted reported was 75 (Satisfactory Condition).

Table 5. Pavement Evaluation Results 2024

Branch:Section	Surface Type	Section Area (SF)	Last Major Work Date	PCI	PCI Category	% Distresses due to Climate	% Distresses due to Load	% Distresses due to Other	Distress Types

The map presented in Appendix A illustrates the PCI associated with each section, the total number of Sample Units in each Section, the number of Sample Units inspected for each section, and the PCI for each Sample Unit inspected.

Figure 6 presents the distribution of pavement area categorized by Pavement Condition Index (PCI) ranges. As depicted, the predominant portion of the pavement area is classified within the "Fair" and "Poor" categories.

Figure 6. Pavement Area by PCI Range

Figure 7 illustrates the area-weighted Pavement Condition Index (PCI), which represents the average PCI adjusted to reflect the relative size of each pavement section, for each airport branch. The map in Figure 8 illustrates the PCI for each airport branch calculated based on the visual inspection conducted in February 2024. This map is presented in a larger format in Appendix B.

Figure 7. Area-Weighted PCI by Branch Use

Figure 8. Pavement Condition Index (PCI) 2024

Appendix C presents photographs taken for each Mangement Section during the PCI field inspection.

Appendix D includes detailed information on the distress severities and extent observed during the field inspection.

6 Pavement Maintenance and Rehabilitation Program

The PAVER pavement management software was updated using the distress information collected during the 2024 pavement inspection, historic records of pavement-related work completed at specific sections, and M&R policies and unit costs. With the updated information, the software PAVER was used to develop three unlimited budget and one allocated budget M&R plans.

6.1 Analysis Parameters

6.1.1 Critical PCIs

PAVER employs critical PCI thresholds to guide the decision-making process between localized preventive maintenance and major rehabilitation efforts. For pavement sections with a PCI above the critical threshold, localized preventive maintenance measures, including crack sealing and patching, are advised. Conversely, for sections falling below this critical PCI, more extensive rehabilitation actions, such as overlaying or reconstruction, are deemed necessary. In the development of the 5-year M&R programs, two distinct critical PCI thresholds were employed (i.e., 55 and 40).

6.1.2 Localized Safety (StopGap) and Preventive Maintenance Policies and Unit Costs

Localized safety and preventive maintenance policies for asphalt-surfaced and Portland Cement Concrete (PCC) pavements have been developed. Table E-1 in Appendix E, outlines maintenance

actions designed to address each various distress types and severities. Table E-2 presents the unit costs for each preventive action, derived from regional pricing and insights from previous projects.

6.1.3 Global Preservation Policies and Unit Costs

Pavement preservation involves activities that are used to extend pavement service life and to delay rehabilitation. These are applied when the pavement is in relatively good condition and does not exhibit structural distresses. Typical applications include slurry seals, chip seals, fog seals, and microsurfacing. The pavement preservation policy used in the development of the M&R plans involves the application of emulsified asphalt seal coats for runway areas, as per FAA specification P-608, and emulsified asphalt slurry seal for non-runway pavements, according to FAA specification P-626. Table E-3 in Appendix E presents the unit costs for global preservation activities used in the development of M&R programs.

6.1.4 Major Rehabilitation Unit Costs

PAVER software estimates the cost of major pavement rehabilitation based on the predicted PCI. Table E-4 in Appendix E details the unit costs for major M&R activities used in the development of M&R programs. When major rehabilitation is recommended within a 5-year outlook, further engineering investigation is recommended. This ensures the selection of the most suitable rehabilitation method and enables a more precise cost estimation for the proposed work.

6.1.5 Budget and Inflation Rate

For the development of the Unlimited Budget M&R plans an unlimited budget was used. For the development of the Allocated Budget M&R plan, the annual budget was distributed as follows:

- **Localized Safety (Stop Gap) and Preventive Maintenance:** \$40,000.
- **Global Preservation:** \$72,000.
- **Major Rehabilitation:** \$1.22 million.

A start date of October 1, 2024, and an inflation rate of 4.0 percent was used for all the M&R plans developed.

6.2 Analysis Approach

As previously noted, under the unlimited budget options, two comprehensive 5-year M&R plans were devised, alongside a separate 1-year plan dedicated solely to addressing localized distresses. The two 5-year plans aim to maintain pavement conditions above established critical PCIs of 55 and 40, offering distinct annual funding alternatives. Conversely, for the Defined Budget option, a singular 5-year plan was developed. The three 5-year analyses encompass three distinct categories of M&R work:

- **Localized Safety (Stop Gap) and Preventive Maintenance:** Localized maintenance policies are meant to identify ongoing, routine maintenance of individual pavement

sections. The safety (stop gap) plan addresses distresses that would affect safety if left unrepaired and is applied to pavements below the critical PCI. The preventive maintenance policy is aimed at slowing the rate of deterioration through consistent pavement maintenance and is generally applied to pavements above the critical PCI.

- **Global Preservation:** Correspond to activities applied to entire pavement sections with the primary objective of slowing down the rate of deterioration. This policy is applied to pavements above the critical PCI.
- **Major M&R:** Correspond to activities applied to the entire pavement section to correct or improve existing structural or functional requirements. It is also used to upgrade pavements below the critical PCI.

The 1-year preventive maintenance plan, using unlimited budget, was conducted to identify the necessary repairs for addressing localized distresses in various pavement sections, aiming to mitigate their deterioration rate. This policy is applied, irrespective of the PCI of each section. Recognizing its limitations, this plan offers an alternative for pavement maintenance when funding for more extensive interventions is unavailable.

6.3 M&R Analysis Results

6.3.1 Unlimited Budget

A summary of the annual costs for the three M&R programs analyzed using unlimited budget is presented in Table 6.

Table 6. Summary Annual Estimated Costs for the M&R Plans

Year	Unlimited Budget		
	5-Year Plan Critical PCI 40	5-Year Plan Critical PCI 55	1-Year Localized Preventive
2024	\$2,999,853	\$6,554,015	\$871,687
2025	\$3,445,381	\$39,467	\$ -
2026	\$898,590	\$50,231	\$ -
2027	\$88,836	\$62,555	\$ -
2028	\$1,146,035	\$76,236	\$ -
Total	\$8,578,694	\$6,782,504	\$871,687

Table 7 and Table 8 present a summary of the annual cost per work type for the two 5-year plans developed using unlimited budget and Critical PCIs of 40 and 55, respectively.

Table 7. Summary of Annual Estimated Costs per Work Type for 5-Year Plan (Critical PCI 40)

Date	Preventive Maintenance	Global Surface Treatment	Major Rehabilitation	Total
2024	\$150,854	\$387,451	\$2,535,234	\$3,073,539
2025	\$73,274	\$0	\$3,372,585	\$3,445,859
2026	\$71,826	\$0	\$827,344	\$899,171
2027	\$89,529	\$0	\$0	\$89,529
2028	\$84,696	\$0	\$1,062,155	\$1,146,851
Total				\$8,654,948

Table 8. Summary of Annual Estimated Costs per Work Type for 5-Year Plan (Critical PCI 55)

Date	Preventive Maintenance	Global Surface Treatment	Major Rehabilitation	Total
2024	\$59,177	\$361,623	\$6,133,215	\$6,554,015
2025	\$39,467	\$0	\$0	\$39,467
2026	\$50,231	\$0	\$0	\$50,231
2027	\$62,555	\$0	\$0	\$62,555
2028	\$76,236	\$0	\$0	\$76,236
Total				\$6,782,504

Table 9 presents a summary of the work activities included in the 1-year localized preventive maintenance plan developed.

Table 9. Summary of Estimated Quantities and Costs per Work Type for 1-Year Plan (Localized Preventive Maintenance)

Work Description	Work Quantity	Work Units	Work Cost
Crack Sealing Wide Cracks	357	Ft	\$892
Crack Sealing - AC	107,526	Ft	\$215,053
Patching - AC Deep	68,740	SqFt	\$653,026
Patching - AC Shallow	408	SqFt	\$2,716
Total			\$871,687

Figure 9 illustrates the total estimated costs for each pavement section under the three M&R plans analyzed. The sections requiring the most repair funds are identified as the Tie-Down Aprons (TD1, TD2, TD3, TD4, TD5) and the Apron section A9. According to the 2024 PCI inspection, the condition of these sections ranged from 'Poor' to 'Failed', with corresponding PCI values of 46, 33, 47, 22, 55, and 1, respectively.

Detailed information on the annual work type and estimated costs for each pavement section for the three M&R works analyzed is presented in Tables F-1 through F-3 of Appendix F. The annual distribution per areas of M&R work for the two 5-year M&R plans is presented in Appendix G.

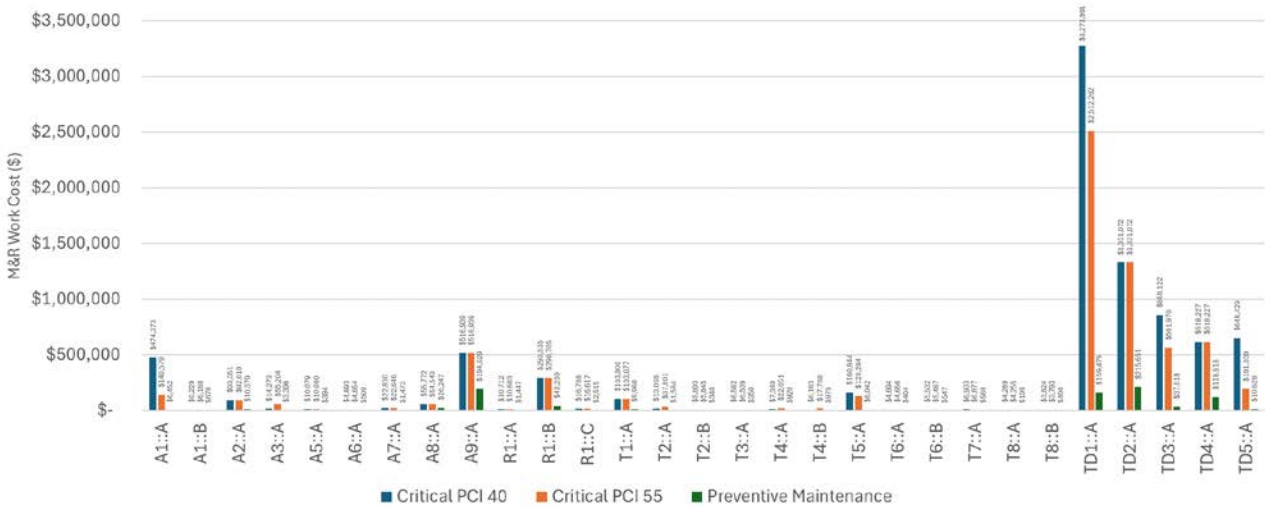

Figure 9. Summary of Estimated Costs per Pavement Section for the Unlimited Budget M&R Plans Analyzed

Considering that the analysis was conducted with an unlimited budget assumption, it is likely that adjustments will be needed to align the pavement repair program with the actual economic and operational constraints at Auburn Municipal Airport. Importantly, the identification of a repair need does not guarantee that funding will be available when needed. It is essential to remember that, irrespective of the report's recommendations, the airport is obligated to prioritize and execute repairs that are critical for maintaining safe operations.

6.3.2 Allocated Budget

A summary of the total estimated costs for the 5-year M&R program analyzed using the allocated budget is presented in Figure 10. The sections requiring the most repair funds are identified as Runway Section B, Tie-Down Aprons (TD1, TD2, TD3, TD4, TD5), and Taxiway 1. According to the 2024 PCI inspection, the condition of these sections ranged from 'Fair' to 'Serious', with corresponding PCI values of 61, 46, 33, 47, 22, 54, and 67, respectively.

Detailed information on the annual work type and estimated costs for each pavement section for the allocated budget M&R plan analyzed is presented in Table F-4 of Appendix F. The annual distribution per areas of M&R work for this 5-year M&R plan is presented in Appendix G.

Figure 10. Summary of Estimated Costs per Pavement Section for the Allocated Budget M&R Plan

6.4 General Maintenance Recommendations

In addition to the specific maintenance activities recommended in the M&R programs developed, it is suggested to consider the following strategies to extend pavement life:

Implement Routine Pavement Inspections: Establish a regular inspection schedule to systematically monitor all pavement areas within the airport. This is crucial for detecting any changes in pavement condition and identifying distresses that could impact safety and ride quality.

Maintenance and Rehabilitation Activity Tracking System: Develop a comprehensive system to track and record all maintenance activities stemming from pavement inspections.

Weed Control Program: Initiate a robust weed control strategy, incorporating regular herbicide applications and mowing of safety areas. This will prevent vegetation from growing in pavement cracks, which can accelerate pavement deterioration and compromise structural integrity.

Periodic Sealing of Cracks and Joints: Implement a scheduled maintenance program for sealing cracks and joints in the pavement. This preventive measure is essential to prevent water and debris infiltration, thereby prolonging the pavement's lifespan and maintaining surface integrity.

Recommendations for Sealing of Wide Cracks: For wide cracks, use a hot-applied mastic sealant, which is a polymer modified asphalt binder combined with specially engineered aggregates and modifiers. This type of material is designed to fill wide cracks preventing water infiltration and

restoring ride quality. It should be flexible to perform well in cold weather and have a high softening point to avoid tracking or rutting with traffic.

Materials and Installation:

1. Melting:

- Use an applicator specifically designed for melting, heating, and applying modified polymerized asphalt sealants with aggregate.
- Heat the transfer oils to 450°F - 525°F. Begin agitation when the material melts and continue until it reaches the recommended application temperatures. Agitate continuously during application.

2. Pavement Temperatures:

- Ensure the pavement temperature is at least 40°F during application. If below 40°F, use a heat lance to warm and dry the asphalt, ensuring cracks are clean and dry for optimal adhesion.

3. Preparation:

- Open cracks to a minimum width of 1 inch and depth of 1 inch. Milling or routing to a depth of 1 inch with a width of 4-10 inches may improve bonding and create a smoother finish.
- Clean bonding surfaces of oil, dirt, dust, and moisture. Use high-powered, oil-free compressed air or a heat lance for preparation. Apply a thin coating of a suitable primer to maximize adhesion.

4. Application:

- Apply the hot-applied polymer modified asphalt binder to distressed areas spanning voids no more than 12 inches wide or 4 inches deep.
- Use proper traffic control procedures to ensure safety and prevent access to uncured or molten sealant areas.

Prevent Dirt Accumulation: Ensure regular cleaning to prevent dirt from accumulating along pavement edges, which can impede proper drainage and create water retention issues ("bathtub" effect). Regular removal of debris and dirt will enhance the effectiveness of drainage systems and prevent water-related damages.

Heavy Equipment Movement Monitoring: Strictly monitor and regulate the movement of heavy equipment across the airport. Limit the operation of such equipment to designated pavements that are structurally capable of handling heavy loads to avoid undue stress and potential premature pavement failure
